STAIRLING TECHNOLOGIES · VISION PAPER & PRODUCT STRATEGY

The Infrastructure of Work

An agentic service infrastructure for the world's platform workers — the blue-collar gig economy. Mobility is the first use case, not the destination.

PREPARED FOR FUNDRAISE & DATA ROOM · VERSION 1.4 · JUNE 2026

A reference document, not a marketing deck.

ABSTRACT

The thesis in one page

Every technological era abstracts a new layer of infrastructure. The internet abstracted communication; AWS abstracted compute; Stripe abstracted payments; Twilio abstracted programmable communication; foundation models abstract intelligence itself. Stairling is building the infrastructure layer for platform work — the blue-collar gig economy.

For thirty years software made companies more productive while leaving the work in human hands. Artificial intelligence breaks that assumption. Software no longer merely assists — it executes. The accountant becomes an agent; the payroll manager becomes an agent; the financial advisor, the business advisor and compliance all become agents. The software disappears and the service remains. We call this transition Services-as-Software, or Thinking Software.

The decisive insight is that the primitives of platform work are universal. Every gig worker has revenue, treasury, accounting, declarations, a legal status, an activity, clients, tax obligations and financial flows. The differences between a driver, a coach, a carer and a cleaner are only the trade and the regulation. We therefore do not build vertical software. We build primitives once and make them parameterizable per tenant — one tenant per country — so country specificity is configuration, not a separate codebase.

We begin with mobility because it is the most demanding operational environment that exists: real-time, high transaction frequency, multiple income streams, regulatory and employment complexity. If the infrastructure works here, it works for every blue-collar gig profession. Drivers are not the destination — they are the proving ground.

WHAT STAIRLING IS

Stairling is not a French mobility startup. It is a new infrastructure layer for the gig economy — an Agentic Service Infrastructure that orchestrates financial, accounting, employment, advisory and operational services for platform workers, across countries and markets. This paper sets out the thesis, the platform, the economics, a 24-month outcome-driven roadmap and a 6-month release plan — culminating in the superapp launch (September 2026): supply, plus salary advances and expense reimbursements, live in workers' hands.

PART I

The Thesis

Why platform work is the next infrastructure layer to be abstracted — and why that abstraction is a category, not a product.

The Infrastructure Layer for Platform Work

Each technological revolution of the last three decades created a new layer of infrastructure — and most of the durable value accrued to whoever built that layer, not the applications on top of it.

Era	Layer abstracted	Infrastructure
Internet	Communication	TCP/IP, the web
Cloud	Compute & storage	AWS
Payments	Money movement	Stripe
Communication APIs	Programmable messaging	Twilio
Intelligence	Cognition	Foundation models
Platform work	Running a one-person business	**Stairling**

Stairling is not a platform and not a SaaS application. It is a new layer of infrastructure: a set of programmable primitives that operate the economic life of a platform worker, exposed so that other products — our own apps, and eventually third parties — can build on top of them.

What "infrastructure layer" means here

An infrastructure layer has four properties. It is composed of primitives rather than features. It is programmable, reachable by API, SDK and embedded surfaces. It is multi-tenant by construction, serving many operators from one core. And it is build-once / configure-many: the cost of the next vertical or country is configuration, not reconstruction.

Platform work is the next domain ripe for this treatment because it is enormous, universal in its primitives, and — until agentic AI — economically impossible to serve. A one-person business cannot afford a finance team, a payroll bureau, a tax advisor and a treasurer. Software priced for companies never fit. The result is a workforce that creates value in the physical world and remains the least digitally empowered group in the economy.

POSITIONING

We do not describe Stairling as "a platform for drivers." We describe it as the infrastructure layer for platform work. Mobility is the first deployment of that infrastructure — chosen for difficulty, not for size.

Services become Software

SaaS rested on a simple premise: software increased productivity, but the work itself remained human. Artificial intelligence dissolves that premise. Software no longer only assists — it performs the work.

In the SaaS model, a worker used an accounting tool to do their accounting faster. In the Services-as-Software model, an agent does the accounting. The distinction is not cosmetic; it changes who the customer is, how the product is priced, and where the moat lives.

Role	Becomes an agent that…
Accounting	classifies flows, books entries and produces statements.
Payroll	computes, declares and pays — within compliant guardrails.
Financial advice	simulates outcomes and recommends the optimal structure.
Business advice	orchestrates the worker's activity for higher revenue.
Compliance	is enforced by design, not by audit after the fact.

The software disappears. The service remains.

THREE CONSEQUENCES

Pricing follows outcomes, not seats. When software performs the work, value is captured on the flow and the result, not on a per-user licence. This is why Stairling is revenue-based rather than subscription-based (Chapter 12).

The moat is data and agents, not UI. The quality of an agent compounds with proprietary data about the worker's real activity. The interface is replaceable; the agent's competence is not.

The worker's administrative tax goes to zero. The promise is not "a better tool." It is the removal of the hours every week that produce no revenue — invoicing, declarations, reconciliation — performed by agents instead.

Cross-Vertical, Cross-Market, Cross-Country

This is the most important chapter. Everyone in the market is building vertical SaaS — for drivers, for couriers, for cleaners, for carers. We do the exact opposite. We build the primitives.

The primitives are universal

Every platform worker, regardless of trade, has the same economic anatomy: revenue, treasury, accounting, declarations, a legal status, an activity, clients, tax obligations and financial flows. These problems are universal. The differences are only the trade (what the activity is) and regulation (where it is performed). The infrastructure underneath does not change.

BUILD ONCE · CONFIGURE MANY

Products are not developed for a trade. They are developed once, then configured. The vertical changes; the infrastructure does not. The country changes; the products do not — only the per-tenant parameters do.

The Stripe analogy, taken seriously

Stripe is not e-commerce software. Stripe provides primitives, which is why it is used by Amazon, Uber, Shopify, Notion and OpenAI alike. Stairling follows the same logic with a different set of primitives: financial infrastructure, accounting infrastructure, employment infrastructure, business infrastructure and supply infrastructure.

Cross-country by tenant configuration

Local rules differ — taxation, employment form, payroll, social protection. We do not isolate them in a separate regulatory engine; we make the primitives parameterizable per tenant, where a tenant maps to a country. The products stay identical; only the per-tenant parameters change; expansion becomes configuration rather than reconstruction.

AGENTIC SERVICE INFRASTRUCTURE

PLATFORM SERVICES (CROSS-INFRASTRUCTURE)
Identity · Auth & Grants Mgmt · Tenant Management
Document Manager · Compliance Manager

DATA PLATFORM (FEEDS THE AI AGENT FARMS)
Data Lakehouse · Semantic Layer · Ingestion & Transformation pipelines
aggregation · standardization · normalization — Text → Graph knowledge (Lettria)

CORE SERVICES · PRIMITIVES (EMBED AI AGENTS THAT INTERFACE VIA MCP SERVERS)

StairPay	StairCount	StairWage	StairWork

MONEY PRIMITIVES — WITHIN STAIRPAY
Acquisition: payment links · tap to pay · invoicing | Spend: pro account (RIB) · corporate card (CB)

VERTICAL SERVICES — SAME PRIMITIVES, CONFIGURED PER TRADE
StairCab (VTC) · StairCoach (coaches & wellness) · Home services · Delivery

TENANTS · ONE PER COUNTRY · PRIMITIVES PARAMETERIZED PER TENANT
France UK Belgium Spain Morocco

Country specificity lives in the parameterized primitives per tenant — not in a separate engine.

The Stairling stack: platform services and data platform under the core-service primitives (with embedded AI agents); StairCab is the VTC vertical; primitives are parameterized per tenant, one per country.

PART II

The Problem & the Timing

The largest operational workforce in the world is the least digitally empowered — and agentic AI has only just made serving it economical.

CHAPTER 04

The Blue-Collar Gig Economy

The next trillion-dollar infrastructure company will not be built around enterprise software. It will be built around the gig workforce that powers the physical economy.

Every day, hundreds of millions of platform workers create value in the physical world: drivers, delivery couriers, maintenance technicians, home-service providers, care and healthcare-support workers, hospitality staff, security professionals, cleaning services, field operators, sports coaches. Together they are the largest operational workforce in the global economy — and they remain the least digitally empowered.

The administrative tax

Every gig worker pays an invisible tax, not in money but in time. Hours each week go to invoicing, accounting, tax reporting, payroll, compliance, reconciliation, customer administration and platform management. None of these generate revenue; they merely allow the worker to keep working. Worse, the burden grows with success: the more a worker earns, the more administration they create.

Why existing software fails them

Traditional software assumes the user operates software. But blue-collar gig workers operate in the real world. A knowledge worker creates value while using software; a blue-collar worker stops creating value when they use software. That single difference changes everything. The answer is not better software — it is software that performs the work itself.

MOBILITY AS BEACHHEAD

Stairling starts with mobility because it is one of the most demanding operational environments that exists: thousands of financial events, real-time decisions, multiple income streams, regulatory and employment complexity, high transaction frequency. If the infrastructure succeeds here, it scales to every blue-collar gig profession. The profession changes; the infrastructure does not. Drivers are not the destination. They are the proving ground.

CHAPTER 05

Why Now

The supervised management of a one-person business by software agents — over voice and a mobile interface — has only just become economically possible. Three curves cross at the same moment.

1 — Agentic AI crosses the cost threshold. For the first time, an agent can read a worker's real activity, reason about their fiscal and social situation, and act within guardrails — at a cost per worker that is a fraction of a human bureau. Supervised agentic management of a business has no scale player today. We hold both the data (the activity flows) and the context (deep knowledge of the trade).

2 — Embedded finance has matured. Modern acquiring, balance-platform and ledgering primitives (Adyen for the banking rail; Formance for real-time wallets and coins) make it possible to build a real financial environment around the worker — accounts, instant pay, cards — without becoming a bank.

3 — The structural pressure on workers is intensifying. Aggregators concentrate demand and commoditize the worker. AI will not replace the driver or the carer, but it intensifies the squeeze applied by whoever owns the demand. Without a technological counter-layer with the same capabilities as the incumbents, the social damage is severe. The timing is not only opportune — it is necessary.

THE CONVERGENCE

Stairling sits at the intersection of AI, embedded finance, platform work and blue-collar digitization. Each alone is a feature. Together they create a category: Agentic Service Infrastructure.

PART III

The Platform

The architecture, the five products, the proprietary data asset, the moat, and the strategy to distribute it like infrastructure.

The Infrastructure Model

Stairling is organized as a single stack: cross-infrastructure platform services and a data platform sit underneath the core services — the primitives — which embed AI agents and are parameterized per tenant. StairCab is the first vertical service built on the same base.

AGENTIC SERVICE INFRASTRUCTURE

PLATFORM SERVICES (CROSS-INFRASTRUCTURE)
Identity · Auth & Grants Mgmt · Tenant Management
Document Manager · Compliance Manager

DATA PLATFORM (FEEDS THE AI AGENT FARMS)
Data Lakehouse · Semantic Layer · Ingestion & Transformation pipelines
aggregation · standardization · normalization — Text → Graph knowledge (Lettria)

CORE SERVICES · PRIMITIVES (EMBED AI AGENTS THAT INTERFACE VIA MCP SERVERS)

StairPay	StairCount	StairWage	StairWork

MONEY PRIMITIVES — WITHIN STAIRPAY
Acquisition: payment links · tap to pay · invoicing | Spend: pro account (RIB) · corporate card (CB)

VERTICAL SERVICES — SAME PRIMITIVES, CONFIGURED PER TRADE
StairCab (VTC) · **StairCoach (coaches & wellness)** · **Home services** · **Delivery**

TENANTS · ONE PER COUNTRY · PRIMITIVES PARAMETERIZED PER TENANT
France **UK** **Belgium** **Spain** **Morocco**

Country specificity lives in the parameterized primitives per tenant — not in a separate engine.

Platform services (cross-infrastructure)

A thin set of services is shared by everything above. They are not domain products; they are the connective tissue of the infrastructure.

Service	What it does
Identity	Who the worker is across platforms and surfaces; “sign in with Uber”; tokens, consent and revocation.
Auth & Grants	Authentication and fine-grained authorization — who may do what, on which tenant, on which resource.
Tenant Management	Provisioning and configuration of tenants; a tenant is country-scoped, and carries that country’s parameters for the primitives.
Document Manager	Generation, storage and lifecycle of documents (payslips, declarations, invoices, contracts).
Compliance Manager	Cross-infrastructure guardrails — never paying out beyond provisioned charges; declaration safeguards; audit trail.

The data platform

Beneath the products sits a data lakehouse with semantic layers and ingestion and transformation pipelines — aggregation, standardization and normalization of every platform activity. On top of it, text→graph pipelines (via tools such as Lettria) turn unstructured text into a knowledge graph, building a corpus the agents can reason over. This is the substrate that the AI agent farms exploit.

Core services, AI agents & MCP

The core services — StairPay, StairCount, StairWage, StairWork — are the primitives. Each is parameterizable per tenant, and each embeds AI agents that, through MCP servers, interface both with the primitives themselves and with the data lakehouse via the semantic layer. The agents do the work; the primitives and the lakehouse are what they act on.

WHERE VERTICALS AND COUNTRIES LIVE

StairCab is a vertical service — specific to VTC — built on the same core. Future verticals are added the same way. Country specificity is a tenant parameter, configured inside the primitives; there is no separate regulatory engine to maintain.

The Core Services, the Copilot & the Verticals

THREE MODES, ONE PROFILE — READ THIS FIRST

Every worker interacts with Stairling through one profile and up to three modes. Supply: Stairling brings the worker demand — rides or missions distributed in white-label from partners who own the audience. OS (Operating System): Stairling runs the worker's business while they remain independent — accounting, declarations, payments. EOR (Employer of Record): Stairling employs the worker in a salaried frame through Stairling Union. Supply sits on top of either; OS and EOR are the two management frames. Everything that follows uses these three terms.

The four core services

Four core services are the primitives. Each owns one capability, agentizes one human role, and is parameterized per tenant.

Product	What it does	Agentizes
StairWork	Ingests, standardizes and normalizes every platform activity (Uber, Bolt, …) into a canonical ontology. The source of truth; produces Gross Stairling.	The data clerk
StairCount	Bookkeeping, invoicing, professional expense management and mileage allowances (IK); FEC-compliant.	The accountant
StairWage	Payroll engine (DSN-native), salary / advance simulation, fair-wage; computes Net Stairling.	The payroll manager
StairPay	Pro account (RIB / IBAN); acquisition primitives (payment links, tap to pay, invoicing); instant pay (advances) and expense payout; corporate card (CB) for pro expenses, balance-gated; on Adyen + Formance.	The treasurer / bank

The AI Copilot

The Copilot is the activity-orchestration layer that sits on top of the core services: ML prediction and recommendation algorithms that steer when, where and which rides or missions to take, so the worker maximizes revenue for the hours worked. Its research foundation is carried through the Munia joint venture, which gives Stairling dedicated applied-research capacity on foundation models for worker-activity data. The Copilot monetizes on the uplift it creates (Chapter 12) and appears throughout this paper wherever activity optimization is discussed.

The vertical services

Vertical services are built on the same core — the vertical changes; the infrastructure does not. Four verticals are identified, in deployment order:

Vertical	Trade	Why it is naturally addressable
StairCab	VTC / ride-hailing	Live today. Ride execution, scoring, dispatch and a voice module. The operational ride-execution knowledge was consolidated through the acquisition of an established ride-hailing operator (transaction in closing; identity withheld pending signature).
StairCoach	Sports coaches & wellness	MVP live in partner studios. Same primitives — revenue collection, accounting, Net optimization — with high per-session acquisition value and low regulatory risk.

Vertical	Trade	Why it is naturally addressable
Home services	Care, cleaning & technicians (SAP)	Recurring missions and a heavy administrative tax; the OS and EOR frames map directly onto the French SAP regime.
Delivery	Couriers	Economics and platform structure adjacent to VTC; StairWork connectors and the supply brick transfer with minimal adaptation.

Two families of money primitives inside StairPay matter for go-to-market. Acquisition primitives let the worker collect revenue from their own private clients — payment links, tap to pay and invoicing — and ship at the superapp launch, alongside Supply. Spend primitives let the worker pay professional expenses — a pro account (RIB / IBAN) and a corporate card (CB) — and land in September–October. Acquisition brings revenue in; the card and pro account take expenses out; both feed the Gross and Net Stairling computation.

Each product embeds AI agents that, through MCP servers, reach the primitives and the data lakehouse (via the semantic layer). The product is the surface; the agent is what performs the work behind it.

ONE PROFILE, ONE ECOSYSTEM

The worker has a single profile (not multiple accounts) and switches between modes — Supply, OS and EOR — the way Airbnb switches host and traveller. One app per vertical: Stairling Driver, Coach, Trainer.

The Proprietary Asset: Gross & Net Stairling

All of the product intelligence crystallizes into two figures that we compute and that no worker can produce alone in real time. (Internally the first is known by its French name, Brut Stairling; this paper uses the English form.)

Gross Stairling. Revenue generated by the worker, minus platform commissions, minus the Stairling commission. What the worker actually controls, before any decision. Fast to produce — the first number we show.

Net Stairling. The truly optimized take-home, after provisioning social charges, declarations, mileage allowances and deductible expenses. A proprietary, agentized figure: today it requires an accountant. It is a suite of fiscal-optimization functions that exposes the gap between what the worker does and the maximum restitution rate.

Two levers and a Graal

- Optimize the Gross via Supply and the Copilot — bring better-paid rides and grow total volume, while the Copilot steers when, where and which rides to take.
- Optimize the Net via the OS — good structural management.
- The Graal — EOR — deduct expenses before the gross, inside a salaried frame. It is the Graal for both sides: the worker reaches their highest Net Stairling, and Stairling earns its highest take-rate and ARPU. The alignment is structural, not rhetorical.

WHY THIS IS THE MOAT AND THE NORTH STAR

Net Stairling is the product. It is proprietary because it is computed, not declared; it improves as more activity data flows through Stairling. The North Star is the incremental Net Stairling created per worker — tracked both in % (restitution-rate gain versus the worker's baseline) and in volume (euros of additional take-home per month). Value created is the North Star; the take-rate — applied to the managed volume, not merely to the increment — is the capture. We win only if the worker wins.

CHAPTER 09

The Moat: Container + Content

The market polarizes into two camps that each hold one half of the answer. Stairling holds both.

On one side, banks and neobanks build rails and hunt for use cases — but their expertise is fintech, not the client's trade. On the other, vertical players know the trade but own neither the rails nor the treasury. Stairling owns the container — the pipes that move money, the Stripe logic — and the content — the interpretation of every line against the worker's real activity, turning it into compliant advice and growth strategy.

> *"A driver building a driving business has no chance against us at the business of running his business."*
>
> Founder vision — offsite

This double mastery compounds into two effects competitors cannot copy from one side: it feeds the best model on the market (the model sees container and content), and it makes workers captive because we master two trades at once — the worker's and the entrepreneur's. The advantage is data × model × treasury, and it widens as flows move onto Stairling.

CHAPTER 10

Platform Strategy: Distribute like Stripe

Infrastructure wins by being embedded where demand already is. Stairling distributes through the same surfaces Stripe pioneered — and turns its supply into "the Stripe of transport."

Mobility brick vs Supply brick

A Mobility brick means hunting clients yourself (the Uber model). A Supply brick means providing the ride, in white-label, to partners who already have the demand. Stairling becomes a White-Label Supply for Partners: fintechs and super-apps (Revolut, Sunday, Alipay/WeChat aggregators) have the audience and the traffic but lack the operations brick — ride execution, regulation, quality of service. We have it. The same logic replicates vertical by vertical: coaching sessions, home-service missions and deliveries are distributed to demand partners through the identical white-label supply brick — only the trade configuration changes.

Surface	For whom	Pattern
API	Large aggregators	Pure endpoints; no interface wanted
SDK	Apps with traffic	Developer portal; embed (e.g. CityMapper, hotel QR via Sunday)
White-label	Small accounts (gig workers)	Turnkey interface
Embedded / Link-like	Checkout surfaces	Cross-surface recognition without storing payments

THE ASSET THAT COMPOUNDS ACQUISITION

The OS brings the workers (the largest driver network in Europe, via the financial infrastructure); that network makes Stairling indispensable to demand partners; demand makes the OS more valuable to workers. Each side acquires the other.

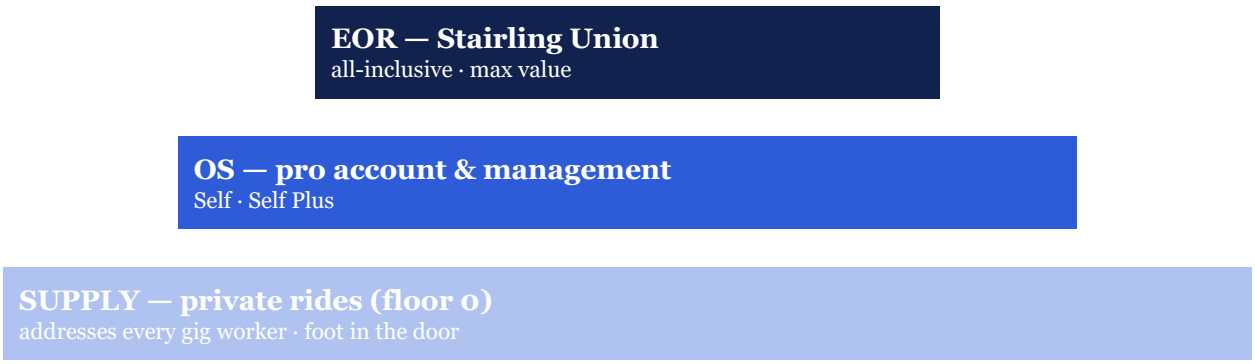

PART IV

Go-to-Market & Economics

How workers enter, how they climb, how Stairling captures value, and the flywheels that make the model compound.

The Value Pyramid & the September Superapp

We never make workers enter through the top of the pyramid. We say “come as you are,” then move them up one stair at a time by showing the gain at each step. That climb is the brand: Stairling.

Enter at the bottom; rise by demonstrated value. Capillarity, not coercion.

Floor 0 — Supply / private rides

No gig worker is indifferent to “more revenue.” Private rides address everyone — the highest-volume entry point. The superapp must serve the “I only want private rides” profile excellently.

Floor 1 — OS / pro account

The self-worker who wants their business run for them. Two offers: Self (micro-enterprise) and Self Plus (company: accounting, statements, payslip).

Floor 2 — EOR / Stairling Union

The one-stop, all-inclusive salaried frame. Highest value — for the worker and for Stairling. Win-win, unlike an aggregator whose interest (cheapest rides) opposes the driver’s.

The wedge: foot in the door and the killing feature

The driver taps Connect with Uber (a black, logo’d button, like sign-in-with-Google); we are immediately inside their account and do their accounting for free. Uber is the entry point because it carries roughly 80% of driver volume — not the perimeter: the same connector pattern extends to Bolt and every other platform, and StairWork centralizes the revenue streams from all of them into one canonical activity view. Then the killing feature: the driver switches their bank details to a Stairling account, KYC completes in minutes (Wise-grade), and we activate instant money — a salary advance or an expense reimbursement, paid out immediately, without waiting for the platform.

THE SUPERAPP LAUNCH (R2, SEPTEMBER 2026) — THE COMMITTED MILESTONE

The launch ships the superapp with, live in workers' hands together: (1) Supply — private rides; (2) the ability to disburse real money — a salary advance or an expense reimbursement — via StairPay; and (3) acquisition primitives to collect from their own clients — payment links, tap to pay and invoicing. The pro account (RIB / IBAN) and the corporate card (CB) for paying professional expenses follow in September–October. Supply and acquisition are the wedge; instant money is the killing feature.

Business Model & Unit Economics

The model is revenue-based, never subscription. Workers are reliable only when they use the product; we remove fixed cost and take a share of the value we create.

The take-rate ladder

Level	Base	Take-rate
Self	Micro-enterprise, natural person	~3% (within a ~25% bundle)
Self Plus	Incorporated (accounting, payroll)	~5%
EOR	Salaried frame; commission on net	~15% of net
Supply	Independent, "on top"	10–18% (sweet spot 10%)
Copilot	Activity orchestration (on the uplift)	2–3% of uplift

The bundle logic (anti-arbitrage)

The worker never sees "3% or 15%" as a menu — otherwise everyone picks 3%. Each level is sold as one all-in bundle, and the worker compares a single figure: how much Net Stairling is left in their pocket. Concretely:

Bundle	What the all-in rate covers	Stairling take inside it	What the worker sees
Self	~25% of revenue, all-in: micro-enterprise social contributions (~21–22%, paid over to URSSAF) + Stairling's OS services	~3%	One rate, zero admin; Net Stairling vs. doing it alone
Self Plus	Company frame: full accounting, statements, payslip, declarations	~5% of revenue	A company run for them; higher deductibility than Self
EOR	Salaried frame via Stairling Union: employment, payroll, social protection, expense deduction before gross	~15% of net	The highest Net Stairling of the three frames
Supply (on top)	Applies per ride brought, on any frame	10–18% of ride value (sweet spot 10%)	Extra revenue they did not have
Copilot (on top)	Applies on the measured activity uplift	2–3% of uplift	More earnings per hour worked

EOR yields a higher Net than OS, but adoption is gated by EOR awareness (in France the OS reassures). The in-app simulation exists to reveal the winning bundle for each worker's situation.

Assets vs intrinsic value

Supply and the AI Copilot are assets with their own business models. The Copilot sits alongside Supply but monetizes through gamification. Stairling thinks of itself as an ecosystem — one profile, many products — the Google/Meta logic.

THE UNIT-ECONOMICS FRAME

At its core the model is a take-rate on the worker's business volume that flows through Stairling. North Star: the incremental Net Stairling created per worker, tracked in % and in volume; the take-rate — applied to the managed volume as a whole, not only to the increment — is the capture. "I win if you win; I don't win if you don't" is both the alignment and the most credible story for investors. The take-rate ladder is validated against live cohort data as workers transact.

CHAPTER 13

The Flywheels

Two compounding loops drive the business: one within a vertical, one across verticals and countries.

FLYWHEEL I — DATA & SERVICE

More workers → more data → better agents → better services → higher revenue → higher retention → more workers. Every additional worker improves the agents, which improves the service, which raises revenue and retention, which brings more workers. This is why incumbents cannot catch up once we lead.

FLYWHEEL II — EXPANSION

New vertical → same infrastructure → small country adaptation → immediate go-to-market → higher network density → lower CAC → higher margins. This is why the company is a category and not a product: each new vertical reuses the same infrastructure, needs only a small country adaptation, goes to market immediately, and arrives into a denser network.

CHAPTER 14

Market & Expansion Sequence

The market is sized by primitives, not by trade. The sequence is deliberate: hardest vertical first, home market first, then configure outward — always within blue-collar gig work.

MARKET SIZING & HOW IT IS BUILT

Europe counts ~43 million platform workers, of which 6–7 million derive their primary income from platforms — the core ICP. Their combined GMV is on the order of €80 bn, growing ~20% per year. Across Stairling's six target markets (France, UK, Belgium, Spain, Morocco) the addressable base is ~250,000 blue-collar gig workers, of which ~150,000 in VTC/ride-hailing — the beachhead. Figures are built bottom-up: EU Platform Work Directive (2024/2831) and EU Commission labor data for the worker base, cross-checked with platform-level driver registries per market; per-vertical ARPU from Stairling's live cohort and pilot data. The full construction is in the market model in the data room.

Sizing by vertical (six target markets)

Vertical	Addressable workers	ARPU target	Wave
VTC / ride-hailing (StairCab)	~150,000	~€1,000 / month	1 — live
Coaches & wellness (StairCoach)	~25,000	~€600 / month	2 — MVP live
Home services (SAP)	~15,000 (premium segment)	~€500 / month	3
Delivery (couriers, full-time)	~60,000	~€400 / month	4

Each subsequent vertical is naturally addressable because the primitives are identical — StairWork connectors, the money primitives, the OS/EOR frames and the supply brick transfer as configuration, not rebuild (Chapter 07).

Country sequence (five markets, Europe / North Africa)

Wave	Markets	Mechanism
1	France	Home market; cooperative / EOR as one tenant
2	UK · Belgium	2026 launches; per-tenant parameterization; products unchanged
3	Spain · Morocco	Per-tenant parameterization; products unchanged

Markets beyond this set (US, Brazil, Asia) are out of scope at this stage — no committed visibility yet.

PART V

Execution

A 24-month roadmap expressed as business outcomes, opportunities and initiatives — and a concrete 6-month release plan to the superapp launch and beyond.

Outcome-Driven Roadmap — 24 Months

The roadmap is expressed as outcomes (the business result we commit to), opportunities (the bets that produce it) and initiatives (what we build). It is read top-down: if an initiative does not serve an outcome, it is cut.

Horizon 1 · Q3–Q4 2026 — Ship the superapp & prove the loop (France)

Outcome & metric	Opportunities	Initiatives
Superapp live: supply + salary advances + expense reimbursements + acquisition (payment links, tap to pay, invoicing) in workers' hands; first cohort transacting and receiving real money. Reconciliation ≥99% · drivers live · supply rides in production · first advances and reimbursements disbursed in production · first client payments collected via acquisition	Foot-in-the-door via private rides and acquisition; instant money (advance / reimbursement) as the killing feature; pro RIB + corporate card to pay expenses; compliant-by-design payout.	StairWork reliability & canonical ontology; reliable Gross Stairling; Net Stairling simulation; StairCab supply; StairWage advance; StairCount expenses + IK + invoicing; StairPay payout + payment links + tap to pay (Adyen); pro account (RIB) and corporate card (Sep–Oct); single Flutter superapp; Connect-with-Uber.

Horizon 2 · Q1 2027 — Monetize the OS & open the Supply

Outcome & metric	Opportunities	Initiatives
Take-rate realized across Self / Self Plus / EOR; first Supply revenue from partners; Copilot in production. ARPU · supply rides/mo · incremental Net Stairling/worker	White-label supply for partners; Copilot upsell on orchestrated activity; closed-loop coins for retention; multi-tenant operations.	Developer portal + API/SDK; white-label supply brick; agentize accounting & payroll at scale; coins (closed-loop) via Formance; super-admin multi-tenant; pricing & bundle engine.

Horizon 3 · Q2–Q4 2027 — Second vertical & second market

Outcome & metric	Opportunities	Initiatives
Multi-tenant parameterization proven on a second country; a second blue-collar gig vertical (sports coaches) onboarded on the same primitives. Time-to-launch vertical/country · CAC reduction · gross margin	Cross-vertical reuse; cross-country via per-tenant parameterization; density-led GTM lowering CAC.	Generalize per-tenant parameterization; vertical configuration layer; onboard sports coaches; launch a second market (UK / BE); reusable onboarding.

Horizon 4 · H1–H2 2028 — Infrastructure at scale / become programmable

Outcome & metric	Opportunities	Initiatives
Stairling used by external partners as infrastructure; multi-vertical, multi-country density. % revenue via embedded/partners · ≥3 verticals	Become the default rails for gig work; an ecosystem others build on; intelligence layer as differentiator.	API Platform GA; agent runtime & partner marketplace; additional verticals/countries; intelligence

Outcome & metric	Opportunities	Initiatives
and ≥3 countries live · net revenue retention		layer (anticipatory advisory) as the headline capability.

6-Month Release Plan

Six monthly releases, July–December 2026, sequenced toward one milestone: the superapp launch (R2, September) with supply and instant money. Reliability gates everything; the Adyen banking rail is started on day one.

Rel.	Month	Scope	Exit criterion
R0	Jul 2026	Foundation + critical paths in parallel. Harden StairWork ingestion; stable internal ID + collection of platform IDs; automated reconciliation + QC; emit events from legacy (strangler). In parallel, start the two long-lead items so September is reachable: StairPay/Adyen payout and StairCab supply plumbing.	≥99% reconciliation on Uber (~80% of traffic); Adyen integration in staging; supply data model live.
R1	Aug 2026	Superapp assembled in staging. Single Flutter superapp shell; reliable Gross Stairling; Net Stairling simulation; StairCab private-rides MVP; StairWage advance + StairCount expenses/IK + StairPay payout wired end-to-end on pilot data; Connect-with-Uber.	Aug 31 internal gate: a pilot driver can, in staging, take a supply ride AND trigger a salary advance or expense reimbursement that pays out.
R2	Sep 2026	SEPTEMBER LAUNCH — the milestone. Superapp live to the first cohort with (1) Supply / private rides; (2) actionable salary advance AND expense reimbursement → real payout via StairPay; and (3) acquisition — payment links, tap to pay, invoicing. Pro account (RIB) opens. Plus IFTM stand (15 Sep) + supply landing (SDK/API/white-label) for partners.	Real drivers receiving real money, taking supply rides, and collecting via payment link / tap to pay / invoice in production.
R3	Oct 2026	Harden, deepen & enable spend. Corporate card (CB) to pay professional expenses, balance-gated; scale the cohort; expand expense rules and IK; restitution up to 100% of Gross Stairling; Copilot orchestration v1; reliability at higher volume.	Corporate card live for pro expenses; stable at higher volume; restitution-to-100% live; first orchestration uplift measured.
R4	Nov 2026	Monetize & open. Take-rate live (Self / Self Plus); EOR (Stairling Union) flow; multi-tenant super-admin; begin white-label supply for first partner.	Take-rate realized in production; first EOR worker paid; first partner in white-label pilot.
R5	Dec 2026	Scale supply. Aggregator supply volume test; closed-loop coins; second-vertical preparation.	Aggregator volume flowing through the new system; coins live in closed loop.

SEQUENCING NOTE

September brings supply, advances and reimbursements live together. To protect the date, September disburses via the OS advance/reimbursement path; the full EOR (Stairling Union) payroll payout follows in R4 (November). This is a deliberate scoping choice, not a constraint on the model.

Architecture & Engineering Principles

GLOBAL CORE, PER-TENANT COUNTRY PARAMETERS

The backend has a global core; country specificity is parameterized per tenant (one tenant per country), inside the primitives — not in a separate engine. France — and the cooperative — is one tenant's parameter set; we do not bake French rules into the core.

THE ACTIVITY-DATA FOUNDATION

Everything rests on activity data being aggregated, standardized and normalized cleanly. The target model — delivered as the first release (R0) — is a stable internal worker ID, a collection of platform identifiers per worker (a worker may hold several Uber IDs over time; an Uber ID maps to exactly one worker; licence numbers change), event-driven re-mapping on attachment, automated reconciliation, a dead-letter queue and QC sampling. The connector is configurable per tenant.

EVENT-DRIVEN BACKBONE & DECOMMISSIONING

We strangle the legacy by making it emit events ("driver attached to Uber" → a consumer fetches the platform UID → mapping). We modify the old app only to remove from it, rebuild on the new, and bridge with webview/iframe both ways during transition.

IDENTITY, ENVIRONMENTS, MOBILE

"Sign in with Uber" is a token-based OAuth flow (Ory Hydra); handle revocation. Rationalize environments (admin vs super-admin; partners get embedded + notifications, not an app). Ship a single cross-platform superapp (Flutter) rather than two native codebases; share contracts via protobuf.

COMPLIANT BY DESIGN

The system can never pay out more than the provision set aside for charges. Declaration safeguards are core functionality, not a patch — and they are our regulatory shield.

Organization & Operating Model

Entity	Role
Stairling Technologies	Global company building the technology and infrastructure for platform workers. Everyone builds — no pure managers (a flat, Tesla-style model). Contribution is measured by the technological asset created.
Stairling Operations	Operates the infrastructure — EOR, supply, OS operations. A tenant / operator of the technology, never an end in itself. Today its perimeter is France, the first tenant; as new country tenants open, each gets its operator. The corporate reorganization formalizing this split is ongoing. We build infrastructure for workers, not B2B SaaS for collaborators.

Structuring roles: a product/engineering lead owns the activity stream and the increment cadence; engineering owns activity reliability with zero tolerance for error; supply operations carry the ride-execution knowledge; research owns the Copilot foundation models; an HR system (SCRH) owns payroll/absence; the founder owns vision, commercial and closing.

KEY-PERSON RISK TO DERISK

Two bodies of knowledge sit with single individuals — ride-execution / supply, and Copilot research. They are strategic assets and key-person risks. Document and redound.

PART VI

Investment & Governance

Why this is a category rather than a company, the risks we take seriously, and the principles that govern how we build.

CHAPTER 19

Investment Thesis

Stairling is a new infrastructure layer for the gig economy. Mobility is the first use case — the hardest one — not the destination.

The next infrastructure category will not emerge from another SaaS application; it will emerge from autonomous services. Stairling sits at the convergence of AI, embedded finance, platform work and blue-collar digitization, creating a category we name Agentic Service Infrastructure.

Why a fund should care

- **Category creation, not share-taking.** No incumbent owns "run the gig worker's business for them" — neither neobanks (rails without trade knowledge) nor vertical SaaS (trade knowledge without rails).
- **Infrastructure economics.** Build-once / configure-many produces declining CAC and rising margins as density grows (Flywheel II).
- **Compounding data moat.** Net Stairling and the agents improve with every worker (Flywheel I).
- **A proving ground that de-risks the thesis.** Mobility is the hardest environment; success there is evidence the infrastructure generalizes.

The comparable trajectories are instructive without being claims: Stripe (primitives, not e-commerce software), Toast (vertical infrastructure that became a category), Deel (employment infrastructure across countries). Stairling combines the financial-rails posture of the first, the operational depth of the second and the cross-country employment engine of the third — for the blue-collar gig worker.

USE OF FUNDS → ROADMAP

Capital is mapped directly to Part V: the superapp launch and the proven loop (H1), monetization and the open Supply (H2), the second vertical and second market that prove multi-tenant parameterization (H3), and the programmable platform at scale (H4). Each tranche buys a named outcome, not a runway.

Risks & Mitigations

Four risks we treat as first-class, each with a concrete mitigation.

1 · Regulatory exposure. URSSAF, mileage allowances, the boundary of compliance. Mitigation, treated as first-class: compliant-by-design (never pay beyond provision), the EOR (Stairling Union) absorbs social-law liability, and a clear responsibility boundary — Technology guarantees the calculations are correct; Stairling Union owns the declared figures.

2 · Activity-data foundation. The infrastructure's value rests on activity data being aggregated, standardized and normalized cleanly. This foundation — stable worker IDs, automated reconciliation, QC — is delivered as the first release (R0) and gates everything downstream by design.

3 · Coins / tokenomics. E-money and accounting complexity. Mitigation: start closed-loop (non-transferable loyalty); defer tradeable coins until legal clarity.

4 · Key-person dependency. Supply / ride-execution and Copilot research sit with single individuals. Mitigation: document and redound.

Design Principles

Principle	What it means
Infrastructure, not application	Build primitives; measure the technological asset created, not ops-time saved.
Services become Software	Software performs the work; price the outcome, not the seat.
Own the container and the content	Rails without trade knowledge, or trade knowledge without rails, do not hold.
Compliant by design	Conformity is a core function, never a patch.
The worker climbs; we climb with them	Win-win, revenue-based: we earn only if the worker earns.
Net Stairling is the product	Proprietary optimization; the North Star everything serves.
Distribute like Stripe	API, SDK, embedded, white-label — meet demand where it is.
Global core, country edges	Build primitives once; parameterize them per tenant (one per country).
Ship increments that create value	Reliability before features; data first.
Stay blue-collar, stay focused	We serve platform gig workers in the physical economy — not white-collar freelancers.

Glossary & Definitions

Term	Definition
Agentic Service Infrastructure	The category: programmable infrastructure that orchestrates financial, accounting, employment, advisory and operational services for any platform worker, via agents.
StairWork	Activity brick: ingestion, standardization and normalization of platform data (Uber, Bolt, …). Produces Gross Stairling.
StairCount	Accounting, professional expenses and mileage allowances (IK); FEC-compliant.
StairWage	Payroll / simulation engine: salary advance, fair-wage, Net Stairling.
StairPay	Banking & payment layer (Adyen + Formance): payout, cards, instant money.
StairCab	Private rides and supply execution; voice module. The VTC vertical service; ride-execution knowledge consolidated via the acquisition of an established ride-hailing operator (in closing).
StairCoach	The coaches & wellness vertical service; MVP live in partner studios.
AI Copilot	Activity-orchestration layer: ML prediction and recommendation steering when, where and which rides/missions to take. Research carried through the Munia joint venture; monetizes on measured uplift.
Munia (JV)	Joint venture carrying Stairling's applied research on foundation models for worker-activity data — the Copilot's research foundation.
Supply / OS / EOR	The three modes on one profile: Supply (demand brought in white-label), OS (business run while independent), EOR (salaried via Stairling Union). Supply sits on top of either frame.
Stairling Union	The French cooperative / EOR — one tenant of the infrastructure among many.
Gross Stairling (Brut Stairling)	Revenue – platform commissions – Stairling commission. The worker's controllable gross. English form used externally; Brut Stairling internally.
Net Stairling	The optimized take-home after charges, declarations, IK and deductible expenses — proprietary and agentized.
Tenant	A country-scoped configuration of the parameterizable primitives. Country specificity (tax, employment form, social rules) lives here — not in a separate engine.
MCP servers	The interface through which each core service's AI agents reach the primitives and the data lakehouse (via the semantic layer).
Acquisition primitives	How the worker collects revenue from their own clients: payment links, tap to pay, invoicing. Ship for September.
Pro account / RIB	The worker's Stairling business account (IBAN) for receiving and paying. Opens at the September launch.
Corporate card (CB)	A balance-gated business card to pay professional expenses. Lands September–October.
Knowledge graph (Lettria)	Text→graph pipelines that build a knowledge corpus exploitable by the AI agents.
EOR / OS	Employer of Record (salaried frame) / Operating System (self-employed management). Mutually exclusive or combined; Supply sits on top of either.
